

CALMED INLET DRAINAGE PACK

- 1 The rodent guard protects the internal water from rodents and large debris which could contaminate the water entering via the overflow.
- 2 The PF filter is designed with a level drop, this along with its very smooth surface structure allows excess dirt to be rinsed straight through into the overflow. The filter cartridge mesh is stainless steel within plastic housing and is self-cleaning, though regular inspection is recommended.
- 3 The service duct is where any electrical or mechanical connections access the tank.
- 4 The calmed inlet removes the kinetic energy from the water as it enters the tank. This means that as the water enters it doesn't stir up the contents of the tank.

ADDITIONAL SPECIFICATIONS:

- Tank sold separately

SYSTEM:

The calmed inlet is designed to filter incoming rainwater and helps prevent it from becoming stained and odorous. The system reduces the velocity of the water as it enters the tank and introduces the water into the lower part of the tank. As a result, the water does not disturb any sediment at the base and replenishes the supply of oxygenated water throughout the tank not solely at the top, keeping the contents fresh for longer.
